

Best way to

Generate

.gitignore File

For Django

Application

Intro

A `.gitignore` file is used to specify untracked files that Git should ignore. This file helps ensure that sensitive or unnecessary files are not pushed to server.

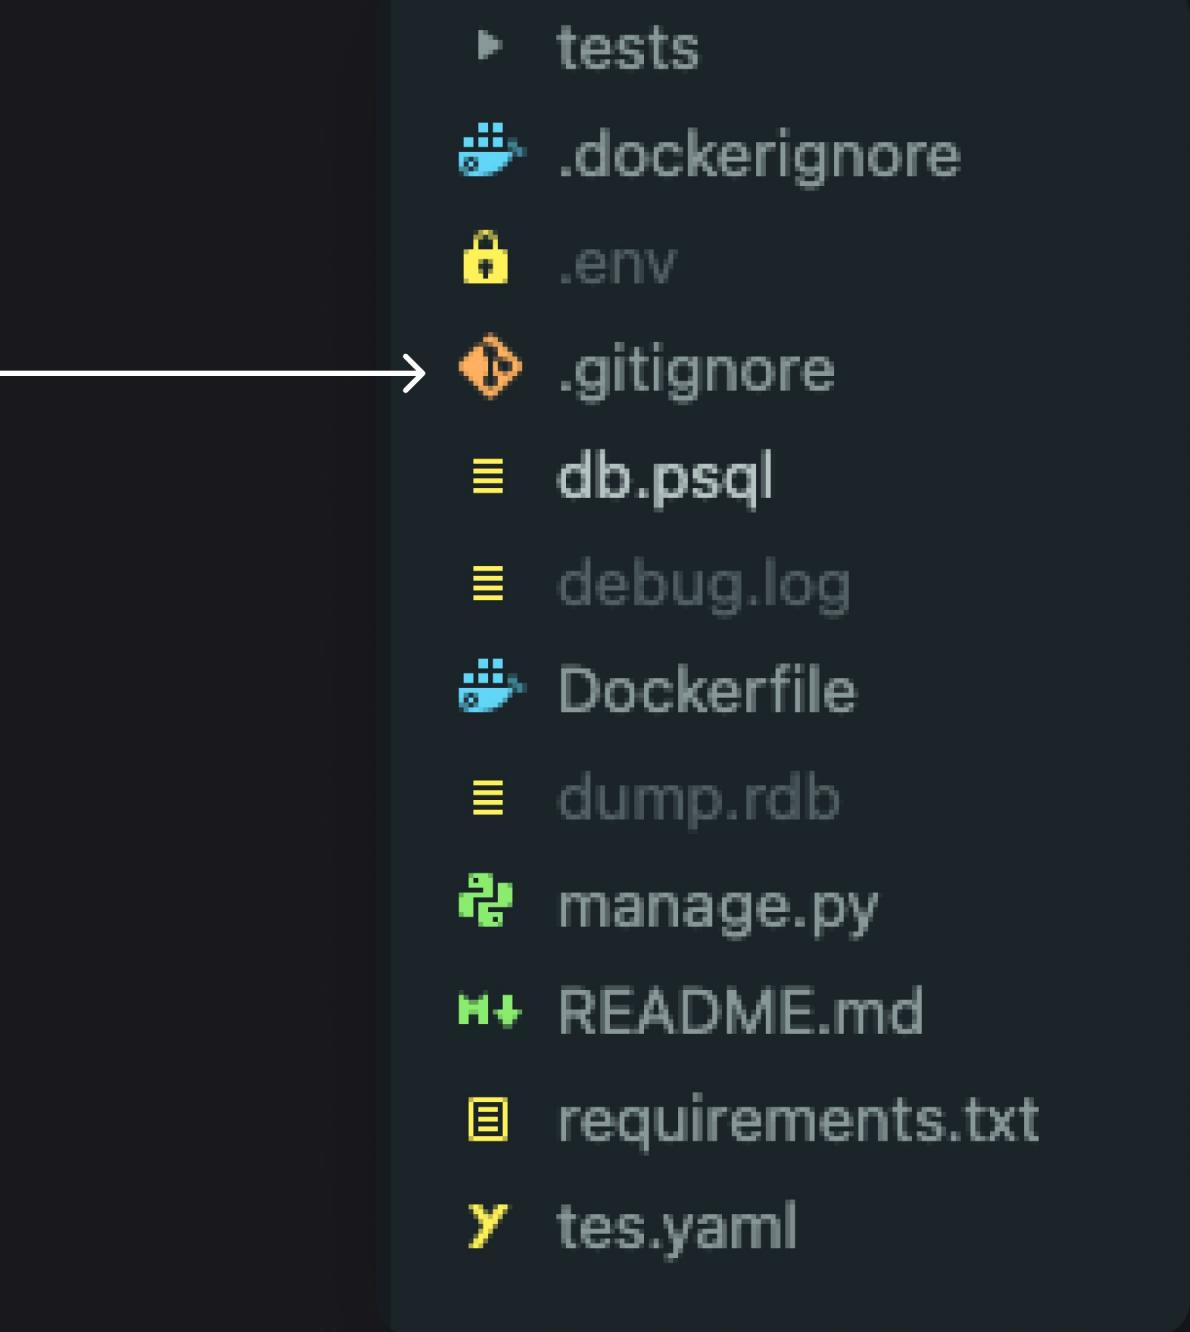

Let's see the best way to create a `.gitignore` file for our django project.

Create .gitignore file

Simply go to your project directory

and create .gitignore file where

manage.py file is located

- 
- ▶ tests
 - ⌚ .dockerignore
 - 🔒 .env
 - 📦 .gitignore
 - ☰ db.psql
 - ☰ debug.log
 - ⌚ Dockerfile
 - ☰ dump.rdb
 - 🐍 manage.py
 - ➡ README.md
 - ☰ requirements.txt
 - ✖ tes.yaml

Generate ignore files

Simply go to this website :

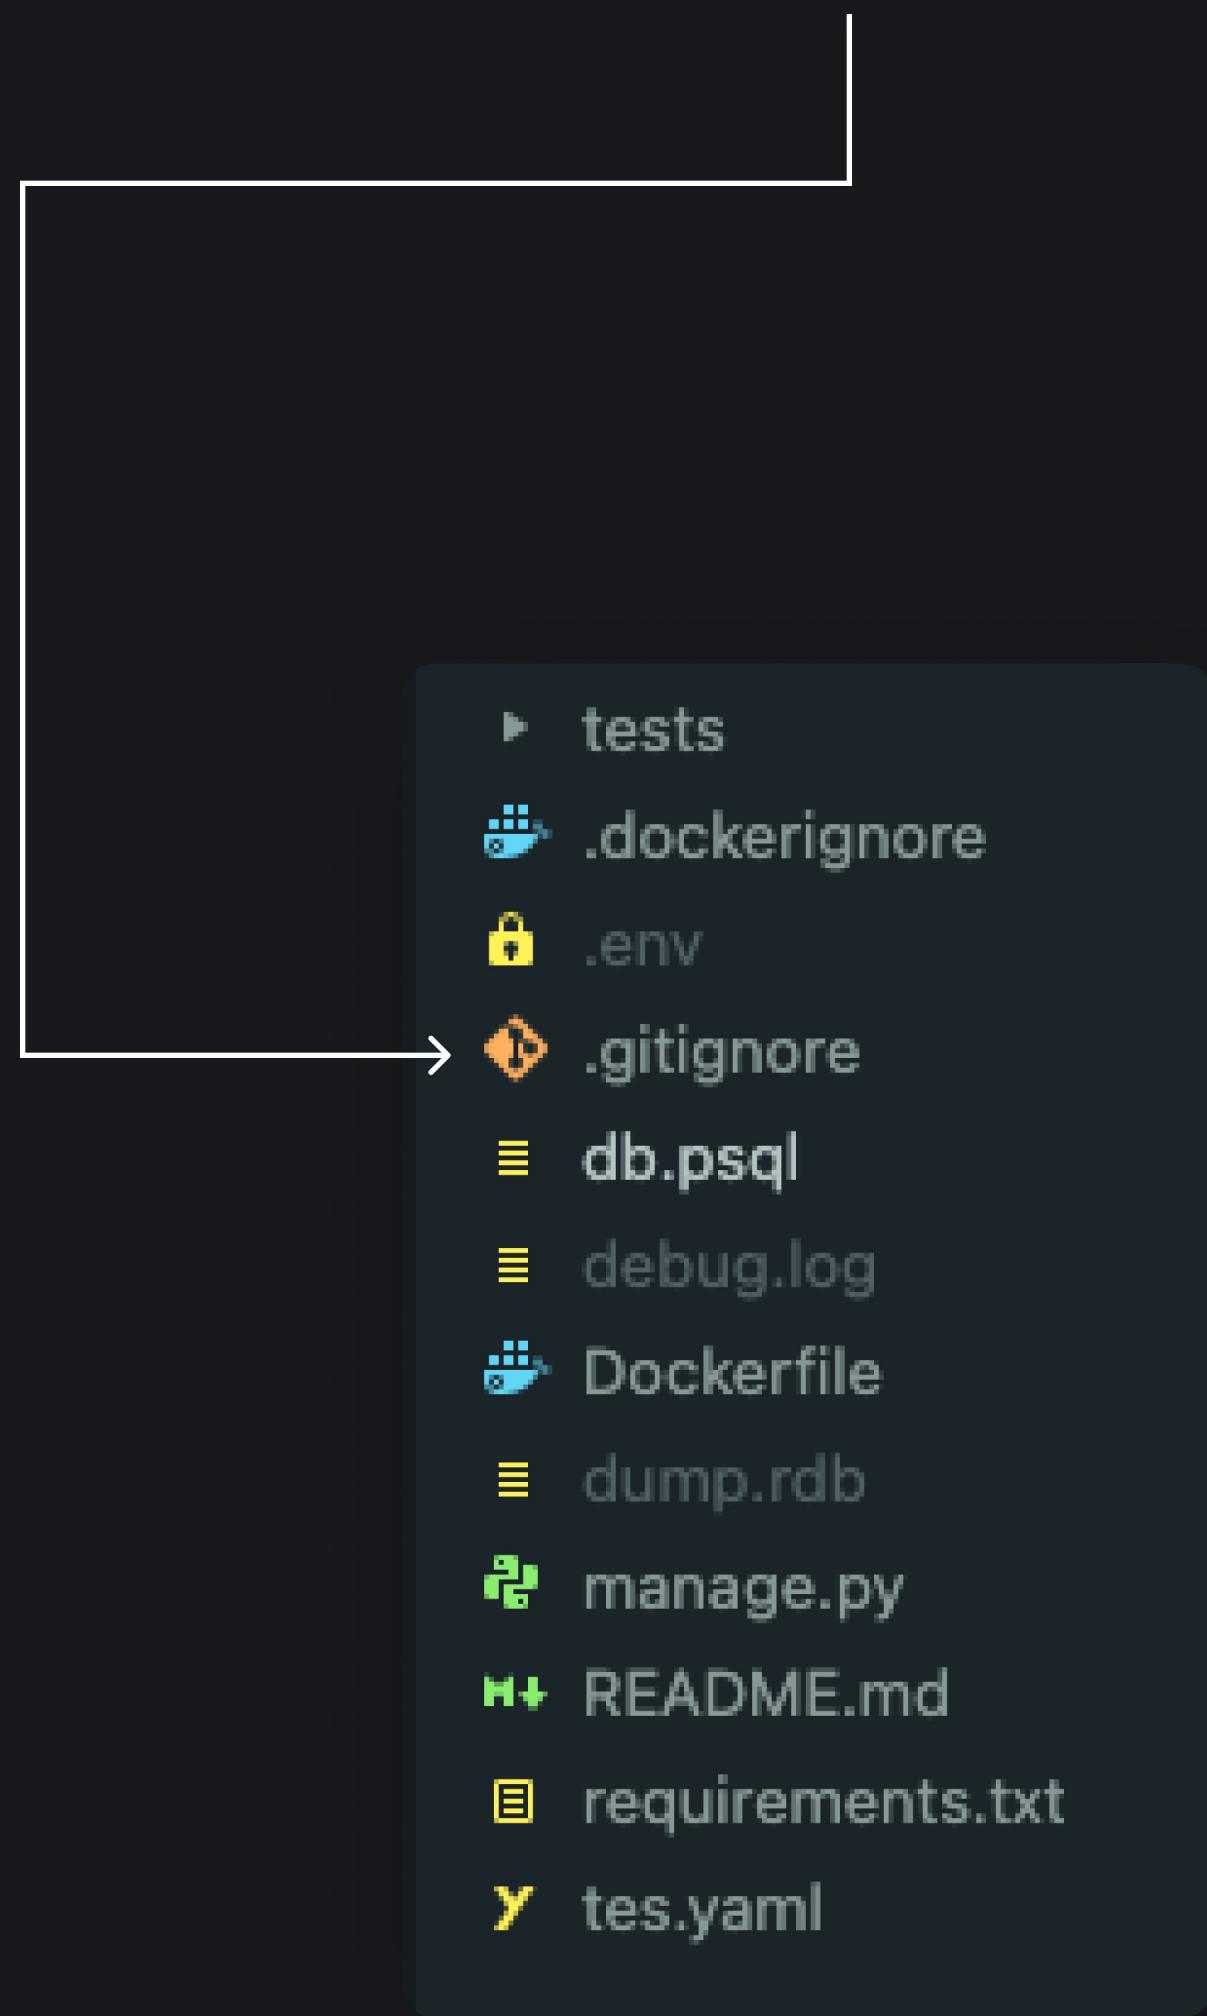

<https://www.toptal.com/developers/gitignore>

and search for django

Click on search, and copy all the files.

Just paste in .gitignore file

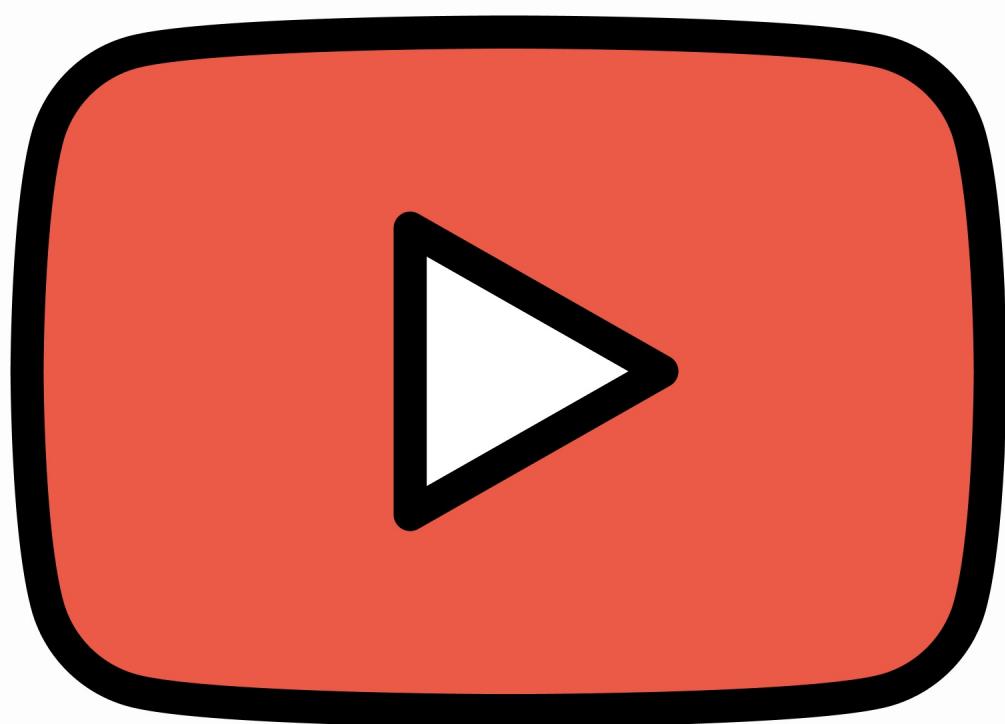

Conclusion

This will generate almost all the files that you don't have to push it server, if anything miss you can add it to manually.
